

## CASE Status Report

Name: Sander Peeters  
CASE title: Sport events  
Report no.: 2  
Date: 25/09/2020

### Current Activities and Problems:

I created a functionality where an user can upload a CSV file and then the system (temorarily!) prints the geographical information about the event in the console. I did not find any problems at the moment.

### Case Project

### Reflection:

It was a little bit difficult to get the right values from the csv file but after some time i figured it out.

### Next Steps:

Enter the extracted geographical data in the geocoding api. Then, I get long and latitude back and with that i can show the location on the map.
